

The background of the slide is a complex, abstract composition. It features a dark, muted purple or brownish background. Overlaid on this are several geometric and data-like elements: a network of thin, light-colored lines forming a mesh or web; numerous small, colored dots (green, blue, yellow) scattered across the space; and a series of vertical, slightly wavy lines on the right side. In the center, there is a large, white, angular shape that resembles a stylized letter 'A' or a large arrow pointing downwards, which serves as a backdrop for the title. To the left of the title, there is a smaller, rectangular inset image showing a cluster of orange and red dots on a light background, with a grid of small black crosses overlaid on it.

# What Is Cluster Analysis?

# What Is Cluster Analysis?

## ❑ What is a cluster?

- ❑ A cluster is a collection of data objects which are
  - ❑ Similar (or related) to one another within the same group (i.e., cluster)
  - ❑ Dissimilar (or unrelated) to the objects in other groups (i.e., clusters)

## ❑ Cluster analysis (or *clustering*, *data segmentation*, ...)

- ❑ Given a set of data points, partition them into a set of groups (i.e., clusters) which are as similar as possible

## ❑ Cluster analysis is **unsupervised learning** (i.e., no predefined classes)

- ❑ This contrasts with *classification* (i.e., *supervised learning*)

## ❑ Typical ways to use/apply cluster analysis

- ❑ As a stand-alone tool to get insight into data distribution, or
- ❑ As a **preprocessing** (or intermediate) step for other algorithms

# Applications of Cluster Analysis

+

# Cluster Analysis: Applications

preprocessing

- ❑ A key intermediate step for other data mining tasks
  - ❑ Generating a compact summary of data for classification, pattern discovery, hypothesis generation and testing, etc.
  - ❑ Outlier detection: Outliers—those “far away” from any cluster
- ❑ Data summarization, compression, and reduction
  - ❑ Ex. Image processing: Vector quantization
- ❑ Collaborative filtering, recommendation systems, or customer segmentation
  - ❑ Find like-minded users or similar products
- ❑ Dynamic trend detection
  - ❑ Clustering stream data and detecting trends and patterns
- ❑ Multimedia data analysis, biological data analysis and social network analysis
  - ❑ Ex. Clustering images or video/audio clips, gene/protein sequences, etc.

The background features a complex geometric pattern of thin, light-colored lines forming a network of triangles and polygons. Overlaid on this are several semi-transparent elements: a horizontal band of purple and blue wavy patterns at the top, a vertical band of orange and red wavy patterns on the left, and a large white banner with a grey border that contains the title. Small grey plus signs are scattered throughout the background.

# **Requirements and Challenges**

# Considerations for Cluster Analysis

## ❑ Partitioning criteria

all clusters are at the same level conceptually.

- ❑ Single level vs. hierarchical partitioning (often, multi-level hierarchical partitioning is desirable, e.g., grouping topical terms)

## ❑ Separation of clusters

- ❑ Exclusive (e.g., one customer belongs to only one region) vs. non-exclusive (e.g., one document may belong to more than one class)

## ❑ Similarity measure

- ❑ Distance-based (e.g., Euclidean, road network, vector) vs. connectivity-based (e.g., density or contiguity)

distance - based optimization techniques  
, density - and connectivity - based arbitrary shape

## ❑ Clustering space

- ❑ Full space (often when low dimensional) vs. subspaces (often in high-dimensional clustering)

# Requirements and Challenges

## □ Quality

- Ability to deal with different types of attributes: Numerical, categorical, text, multimedia, networks, and mixture of multiple types
- Discovery of clusters with arbitrary shape
- Ability to deal with noisy data

## □ Scalability

Large dataset may lead to biased results.

- Clustering all the data instead of only on samples
- High dimensionality
- Incremental or stream clustering and insensitivity to input order

## □ Constraint-based clustering

- User-given preferences or constraints; domain knowledge; user queries

## □ Interpretability and usability

[ ]

\* Ability to deal with different types of attributes  
- complex data types (graph, sequence, img, text)

\* Discovery of clusters with arbitrary shape  
- a cluster could be of any shape

\* Cluster algorithms are Sensitive to parameters, noise, input data order

The background is a complex collage of abstract elements. It features a grid of small grey plus signs, a network of red lines connecting green dots, and a vertical strip of orange and red dots. A large, light grey, angular shape is positioned behind the text.

# **A Multi-Dimensional Categorization**

# Cluster Analysis: A Multi-Dimensional Categorization

---

## ❑ Technique-Centered

- ❑ Distance-based methods
- ❑ Density-based and grid-based methods
- ❑ Probabilistic and generative models
- ❑ Leveraging dimensionality reduction methods
- ❑ High-dimensional clustering
- ❑ Scalable techniques for cluster analysis

## ❑ Data Type-Centered

- ❑ Clustering numerical data, categorical data, text data, multimedia data, time-series data, sequences, stream data, networked data, uncertain data

## ❑ Additional Insight-Centered

- ❑ Visual insights, semi-supervised, ensemble-based, validation-based

The background is a collage of various data visualization techniques. It includes a network graph with red lines and green nodes, a scatter plot with orange and blue points, a heatmap with a color gradient from blue to red, and a grid of small plus signs. The text is centered over a white, angular shape.

# **An Overview of Typical Clustering Methodologies**

# Typical Clustering Methodologies (I)

---

## □ Distance-based methods

- Partitioning algorithms: K-Means, K-Medians, K-Medoids
- Hierarchical algorithms: Agglomerative vs. divisive methods

## □ Density-based and grid-based methods

- Density-based: Data space is explored at a high-level of granularity and then post-processing to put together dense regions into an arbitrary shape
- Grid-based: Individual regions of the data space are formed into a grid-like structure

## □ Probabilistic and generative models: Modeling data from a generative process

- Assume a specific form of the generative model (e.g., mixture of Gaussians)
- Model parameters are estimated with the Expectation-Maximization (EM) algorithm (using the available dataset, for a maximum likelihood fit)
- Then estimate the generative probability of the underlying data points

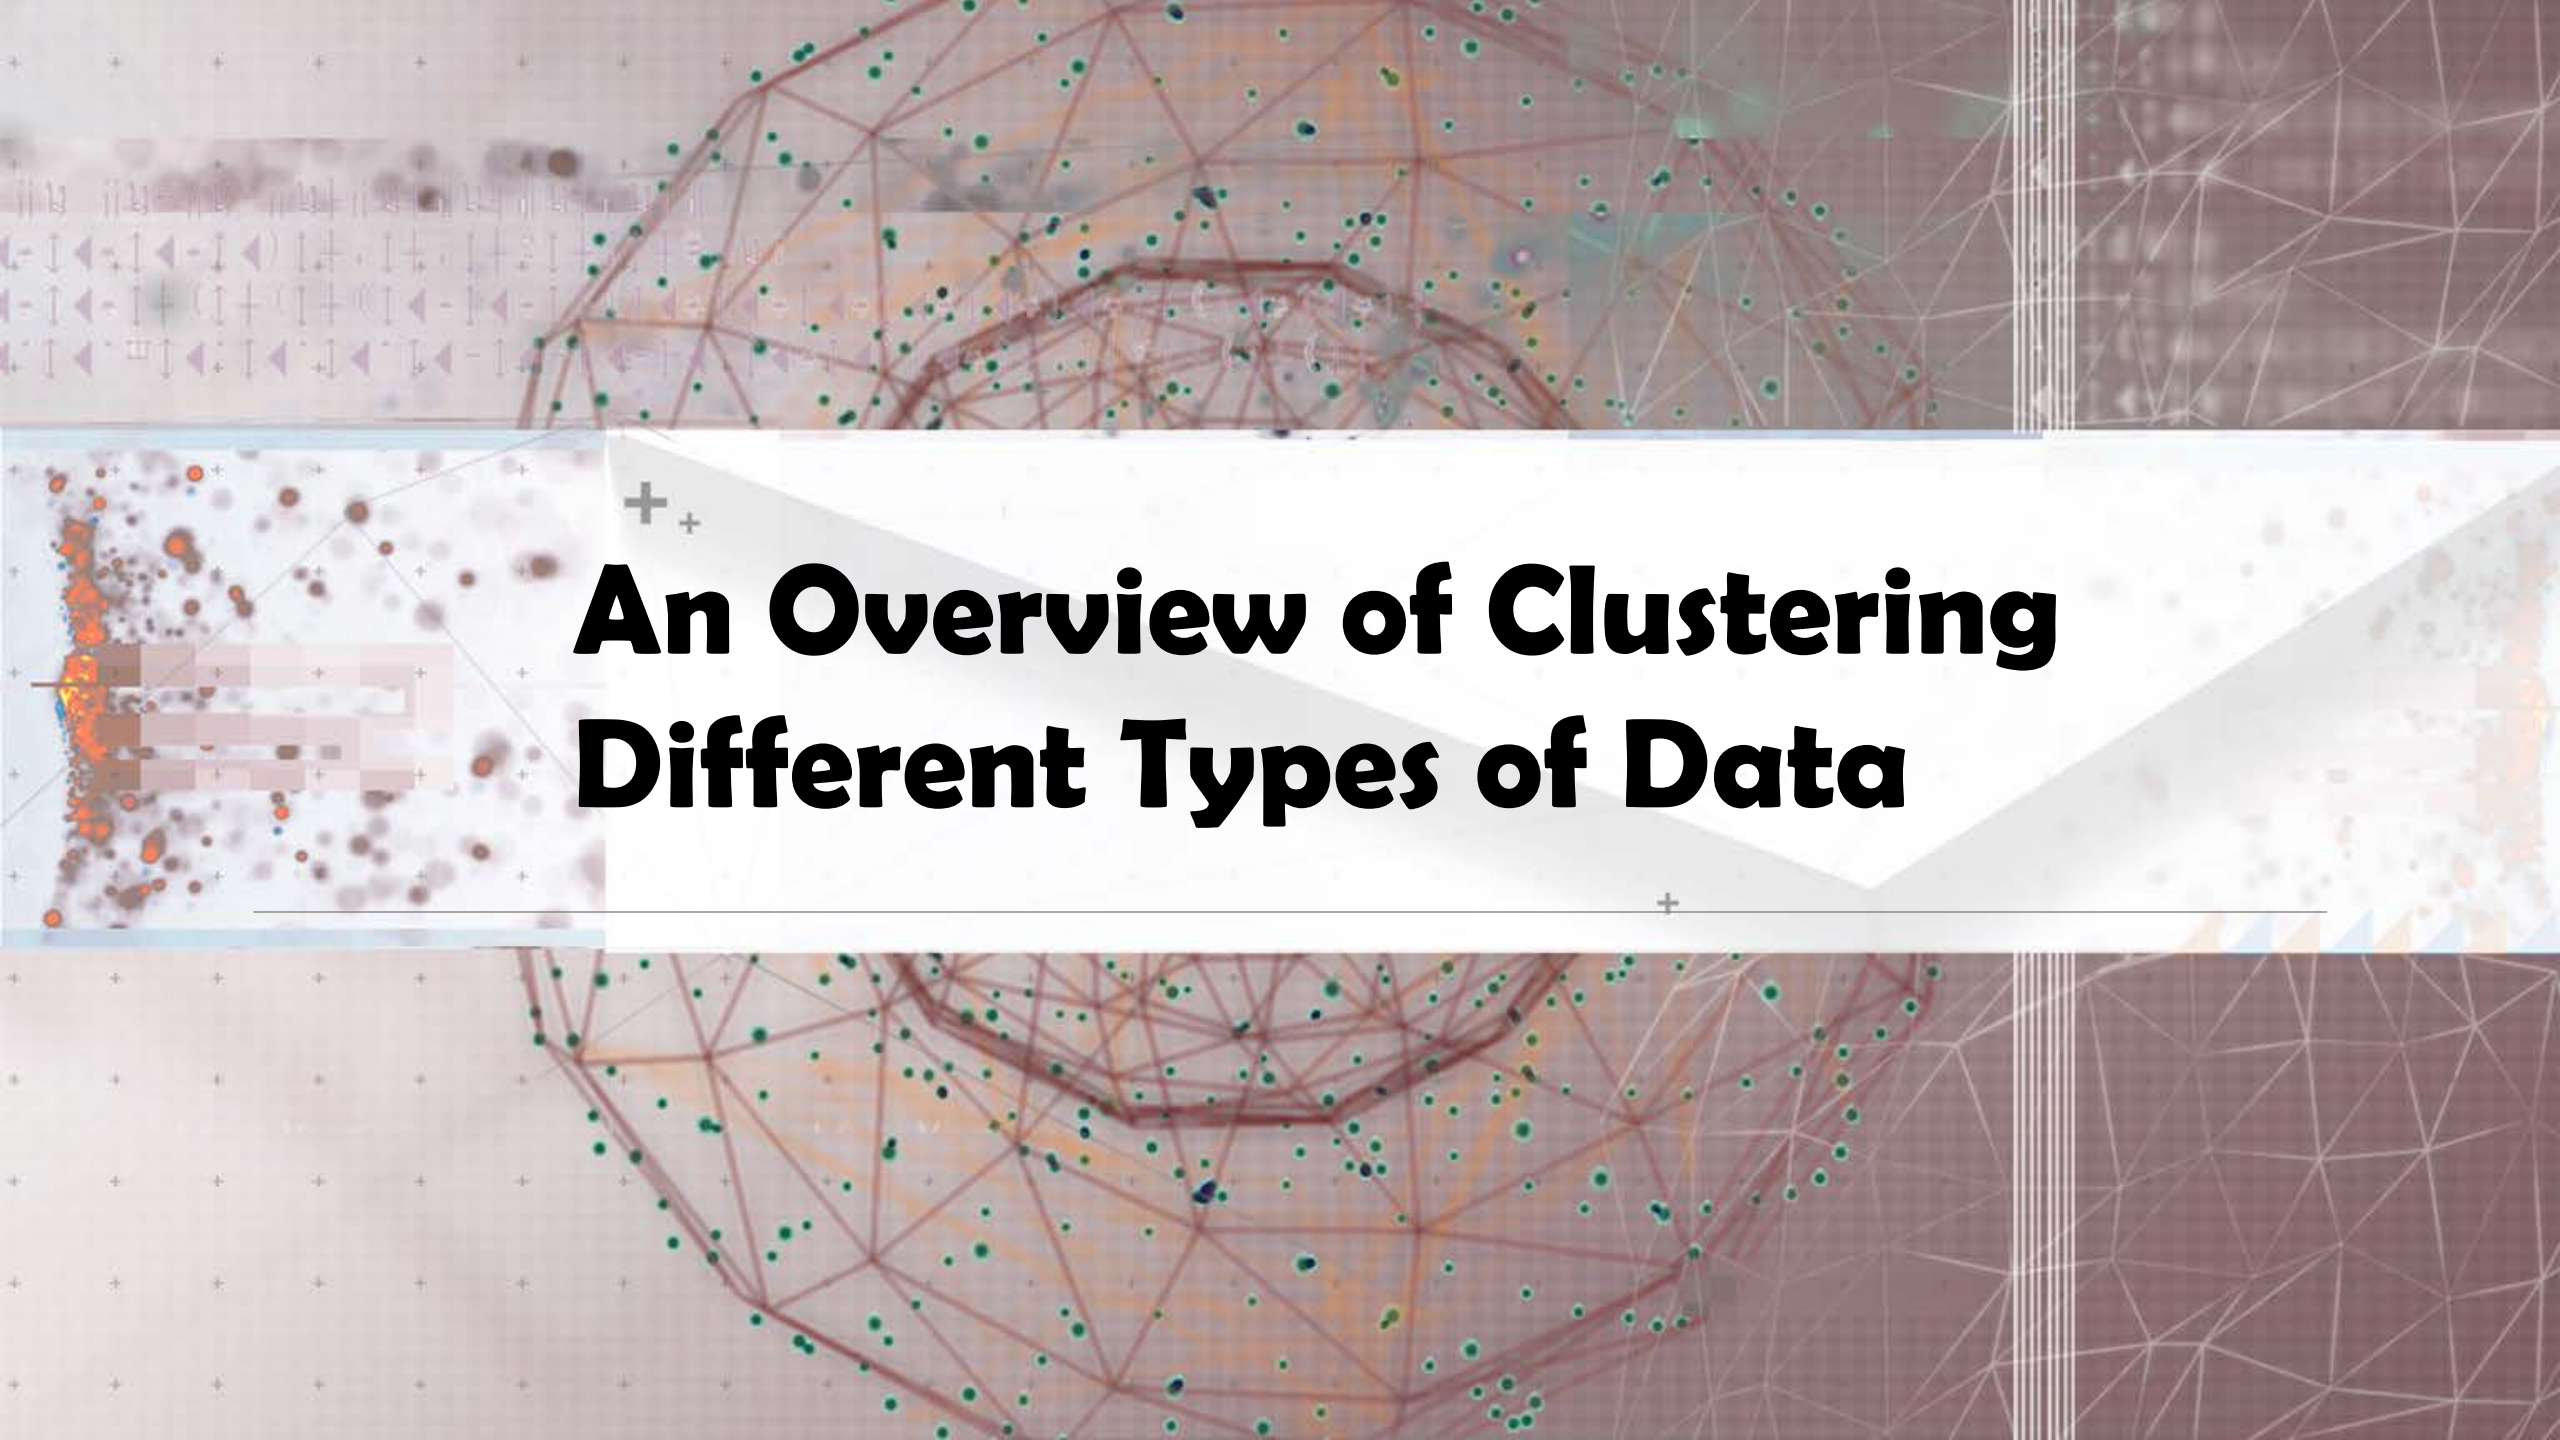

# Typical Clustering Methodologies (II)

---

## □ High-dimensional clustering

- Subspace clustering: Find clusters on various subspaces
  - Bottom-up, top-down, correlation-based methods vs.  $\delta$ -cluster methods
- Dimensionality reduction: A vertical form (i.e., columns) of clustering
  - Columns are clustered; may cluster rows and columns together (co-clustering)
- Probabilistic latent semantic indexing (PLSI) then LDA: Topic modeling of text data
  - A cluster (i.e., topic) is associated with a set of words (i.e., dimensions) and a set of documents (i.e., rows) simultaneously
- Nonnegative matrix factorization (NMF) (as one kind of co-clustering)
  - A nonnegative matrix  $A$  (e.g., word frequencies in documents) can be approximately factorized two non-negative low rank matrices  $U$  and  $V$
- Spectral clustering: Use the *spectrum* of the similarity matrix of the data to perform dimensionality reduction for clustering in fewer dimensions

The background features a complex network of red lines connecting green dots, resembling a graph or a neural network. On the left, there is a vertical strip showing a cluster of orange and red dots. The overall aesthetic is technical and data-driven.

# **An Overview of Clustering Different Types of Data**

# Clustering Different Types of Data (I)

---

## ❑ Numerical data

- ❑ Most earliest clustering algorithms were designed for numerical data

## ❑ Categorical data (including binary data)

- ❑ Discrete data, no natural order (e.g., sex, race, zip-code, and market-basket)

## ❑ Text data: Popular in social media, Web, and social networks

- ❑ Features: High-dimensional, sparse, value corresponding to word frequencies
- ❑ Methods: Combination of k-means and agglomerative; topic modeling; co-clustering

## ❑ Multimedia data: Image, audio, video (e.g., on Flickr, YouTube)

- ❑ Multi-modal (often combined with text data)
- ❑ Contextual: Containing both behavioral and contextual attributes
  - ❑ Images: Position of a pixel represents its context, value represents its behavior
  - ❑ Video and music data: Temporal ordering of records represents its meaning

# Clustering Different Types of Data (II)

---

- ❑ **Time-series data:** Sensor data, stock markets, temporal tracking, forecasting, etc.
  - ❑ Data are temporally dependent
  - ❑ Time: contextual attribute; data value: behavioral attribute
  - ❑ Correlation-based online analysis (e.g., online clustering of stock to find stock tickers)
  - ❑ Shape-based offline analysis (e.g., cluster ECG based on overall shapes)
- ❑ **Sequence data:** Weblogs, biological sequences, system command sequences
  - ❑ Contextual attribute: Placement (rather than time)
  - ❑ Similarity functions: Hamming distance, edit distance, longest common subsequence
  - ❑ Sequence clustering: Suffix tree; generative model (e.g., Hidden Markov Model)
- ❑ **Stream data:**
  - ❑ Real-time, evolution and concept drift, single pass algorithm
  - ❑ Create efficient intermediate representation, e.g., micro-clustering

# Clustering Different Types of Data (III)

## □ Graphs and homogeneous networks

- Every kind of data can be represented as a graph with similarity values as edges
- Methods: Generative models; combinatorial algorithms (graph cuts); spectral methods; non-negative matrix factorization methods

## □ Heterogeneous networks

- A network consists of multiple typed nodes and edges (e.g., bibliographical data)
- Clustering different typed nodes/links together (e.g., NetClus)

## □ Uncertain data: Noise, approximate values, multiple possible values

- Incorporation of probabilistic information will improve the quality of clustering

## □ Big data: Model systems may store and process very big data (e.g., weblogs)

- Ex. Google's MapReduce framework
  - Use *Map* function to distribute the computation across different machines
  - Use *Reduce* function to aggregate results obtained from the Map step

The background features a complex network graph with red lines connecting green and blue nodes. On the left, there is a smaller inset showing a heatmap with orange and red clusters. The overall aesthetic is technical and data-driven.

# **An Overview of User Insights and Clustering**

# User Insights and Interactions in Clustering

---

- **Visual insights:** One picture is worth a thousand words
  - Human eyes: High-speed processor linking with a rich knowledge-base
  - A human can provide intuitive insights; HD-eye: visualizing HD clusters
- **Semi-supervised insights:** Passing user's insights or intention to system
  - User-seeding: A user provides a number of labeled examples, approximately representing categories of interest
- **Multi-view and ensemble-based insights**
  - Multi-view clustering: Multiple clusterings represent different perspectives
  - Multiple clustering results can be ensembled to provide a more robust solution
- **Validation-based insights:** Evaluation of the quality of clusters generated
  - May use case studies, specific measures, or pre-existing labels
